# Tips For Curing Homegrown Cannabis

After your cannabis is dried and processed, it's time to think about curing, burping, and re-humidifying your crop to the perfect smoking and vaping consistency. Much like the process of aging fine wine or spirits, curing cannabis for only a few weeks has the potential to unlock some of your crop's most desirable qualities.

### Why Cure Cannabis?

Unlike drying, which is simply the process of removing moisture from cannabis, curing is a procedure of long-term storage that helps flavors, aromas, and terpenes reach their full potential. In ideal circumstances, properly curing cannabis can elevate the outcome of a harvest, leading to tighter flowers and more intense flavors and aromas.

### How to Cure Cannabis Step-by-Step

#### Step #1: Place Freshly Dried Cannabis into Jars

Begin the curing process by placing freshly dried and trimmed cannabis into airtight jars. The curing process can only take place once the gasses trapped in cannabis flowers have an opportunity to swell, contract, and marinate in a sealed environment.

1 PLACE FRESHLY DRIED CANNABIS INTO JARS

2 SEAL THE LID ON THE JARS

#### Step #2: Cure in Cool, Dark Place

Providing your buds with a cool and dark space will reduce the likelihood of heat and light exposure. While it is a good idea to monitor your curing flowers on a daily basis, keeping your cannabis in complete darkness over the curing period will ensure the outcome of your garden remains delicious and desirable.

#### Step #3: "Burb" Your Crop Daily

An oxygenation process called "burping" may also be useful during this stage. To fight the build-up of excess humidity, open your container and add fresh air to your curing jars by fluffing or "burping" the flowers inside. Burping your crop daily will cause an instant air exchange, allowing stale air and moisture to be removed from the mason jar.

1 OPEN YOUR CONTAINER AND ADD FRESH AIR TO YOUR CURING JARS BY FLUFFING OR "BURPING" THE FLOWERS INSIDE

7 days

2

BURP YOUR CROP DAILY FOR THE FIRST WEEK AFTER SEALING YOUR CANNABIS IN THE JARS.

### **Step #4:** Re-humidify Your Cannabis

If desired, the curing process can continue for several months. So, to maintain flowers with an ideal smoking humidity, consider re-humidifying your cannabis with 2-way humidity packs. Boveda makes some of the industry's most reliable humidity controls. Simply insert your Boveda pack into your curing container and watch your cannabis come back to life with a relative humidity of 50-60%.

1 STABILIZE YOUR CROP AT A HUMIDITY LEVEL BETWEEN 50-60%

INSERT A BOVEDA PACK INTO YOUR CURING CONTAINER AND WATCH THE CANNABIS COME TO LIFE

Cannabis stored in the appropriate environment will be viable for the next six to eight months.

Congratulations on finishing your cannabis-growing journey with us! If you experience any issues with your own cannabis plants, don't hesitate to reach out to the team at Grow Your Four for more advanced or technical information.
